LABOUR FORCE SURVEY, SEPTEMBER 2000 TO MARCH 2005: HISTORICAL SERIES OF REVISED ESTIMATES

This report presents a selection of key labour market indicators based on revised LFS (Labour Force Survey) estimates

1 Introduction

Statistics South Africa has updated the entire series of LFS results to reflect the new population estimates released in February 2005. Until now, only the two most recent rounds of the LFS (released in March and June this year) reflected these new estimates. In addition, all rounds of the series have now been benchmarked to Census 2001, including the early rounds that were previously benchmarked to Census '96. The resulting estimates are now comparable for the entire series to date.

In view of the sample size, caution must be exercised when interpreting LFS data at geographic levels lower than province.

A table showing a comparison of old and new key indicators will be published at a later stage.

2 The labour market, September 2000 to March 2005

2.1 The working-age population

Figure 1: The working-age population

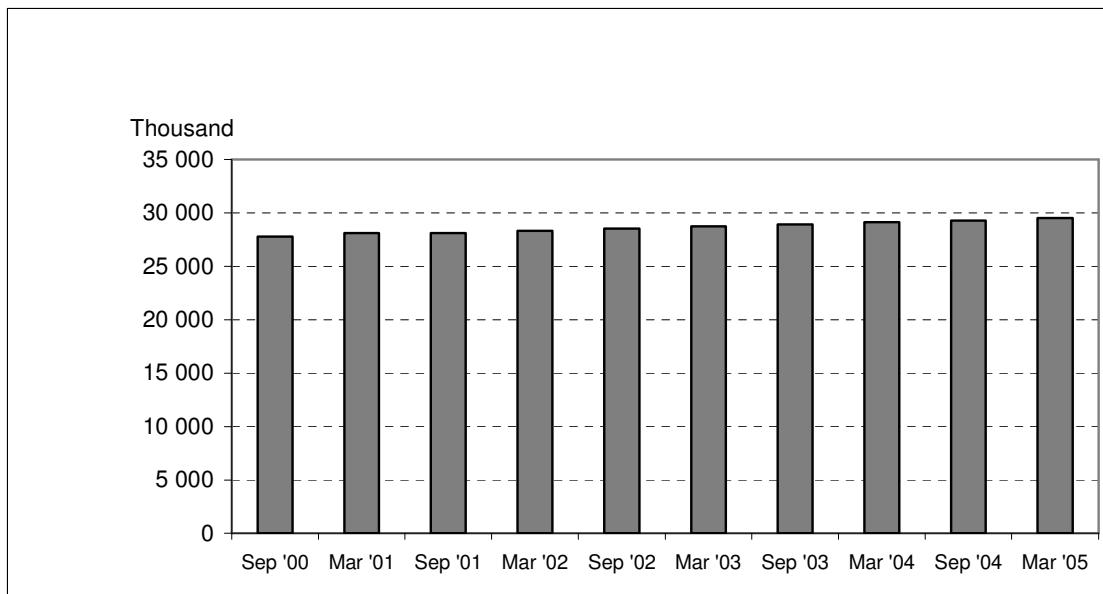

Figure 1 and Table 1(pp. 1-4) show a steady increase in the working-age population (all persons aged 15-65 years) since the inception of the LFS programme in September 2000.

In September 2000, the working-age population totalled 27,8 million persons. By March 2005 this total had risen to 29,5 million persons.

2.2 Labour market measures

Figure 2: Components of the working-age population (official definition of unemployment)

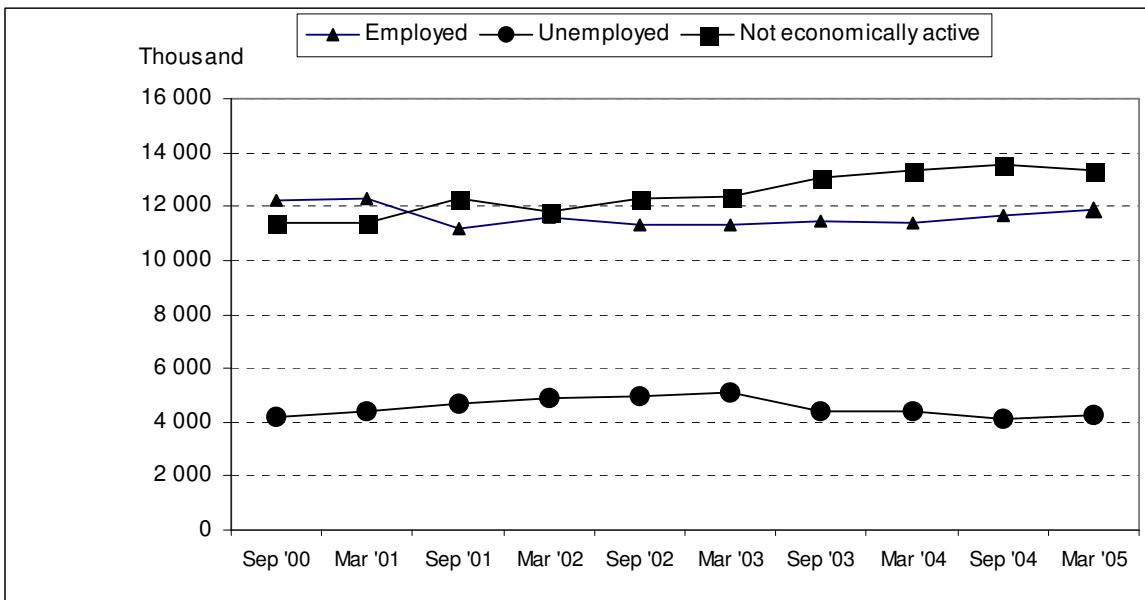

Figure 2 and Table 1 show the trend in the number of persons in each of the three components of the working-age population over the period September 2000 to March 2005.

- The number of employed persons was 12,2 million in September 2000. This was followed by a decline to 11,2 million in September 2001, after which employment levels rose in virtually every period to 11,9 million by March 2005.
- The number of unemployed persons rose steadily from 4,2 million in September 2000, to a peak of 5,1 million in March 2003, before declining to 4,3 million in March 2005.
- The number of not economically active persons was lowest at the beginning of the period (11,4 million in September 2000 and March 2001) rising to over 13 million from September 2003 to March 2005.

3 Unemployment patterns

3.1 Official unemployment by sex

Figure 3: Unemployment rates by gender (official definition of unemployment)

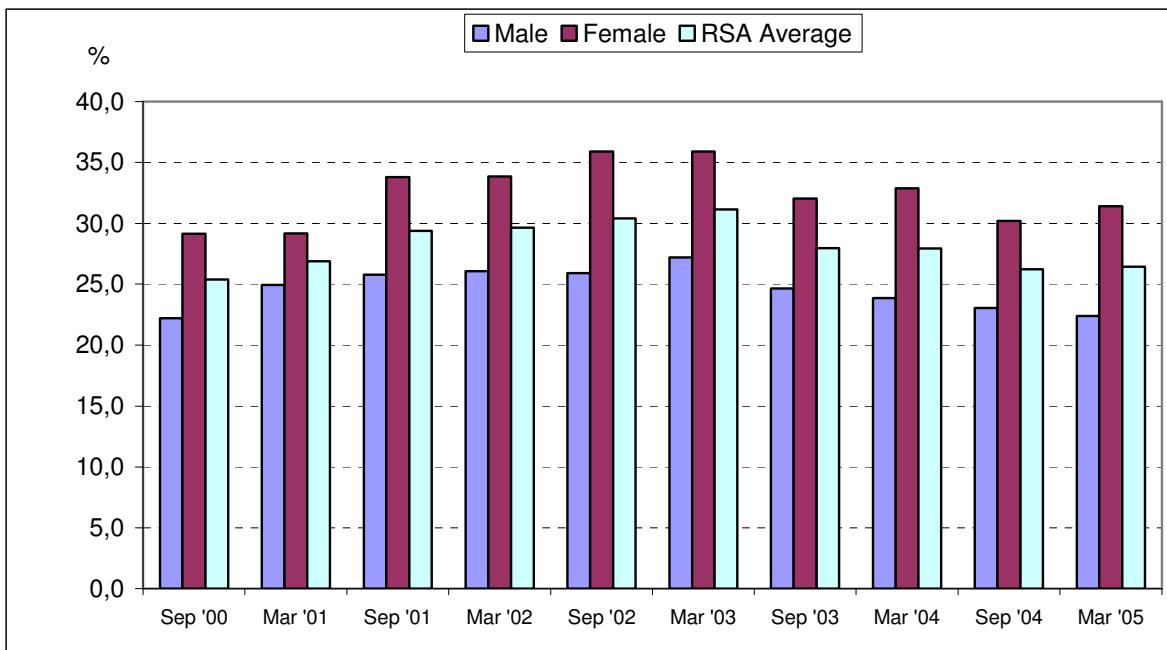

Figure 3 shows the trend in unemployment rates over the period September 2000 to March 2005. In this respect, the notable features of Figure 3 and Table 1 are as follows:

- There are marked gender differences in unemployment rates. For example, in September 2000, the unemployment rate among men was 22,2% whereas among women it was 29,2%. The gap between male and female unemployment rates was largest in September 2002 (10,0 percentage points) and smallest in March 2001 (4,1 percentage points).
- The overall unemployment rate (RSA average) rose from 25,4% in September 2000 to a peak of 31,2% in March 2003, before declining to 26,5% in March 2005.
- The official unemployment rate shows a stable curvilinear pattern over time.

3.2 Discouraged work-seekers

Figure 4: Discouraged work-seekers as a percentage of the working-age population

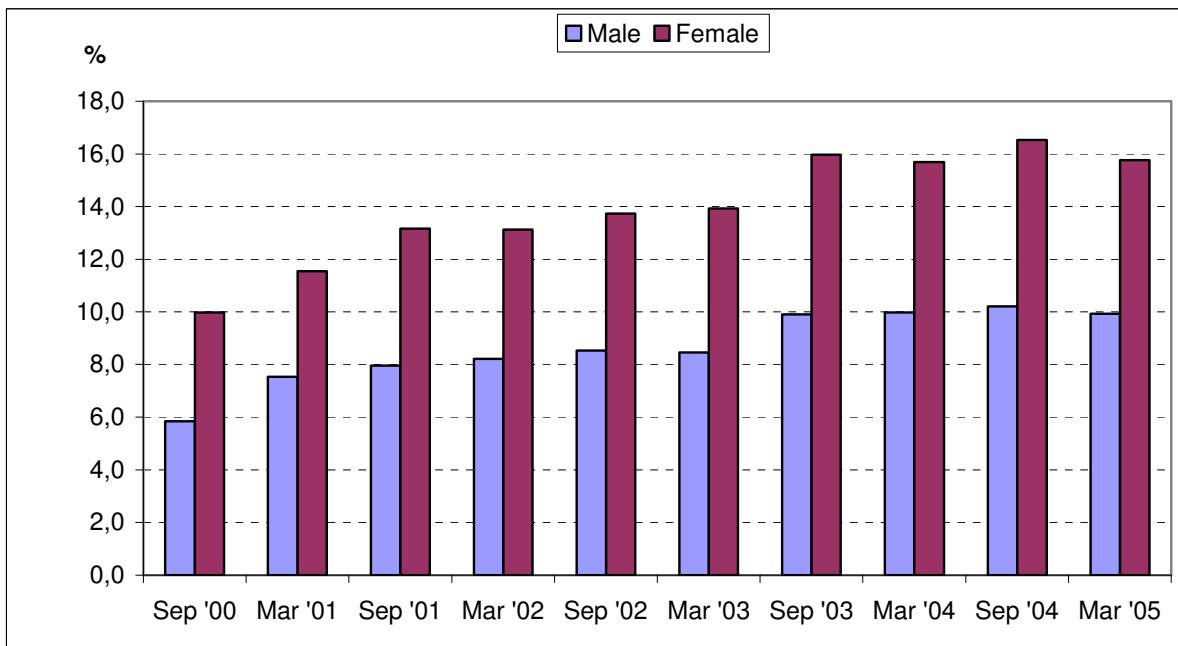

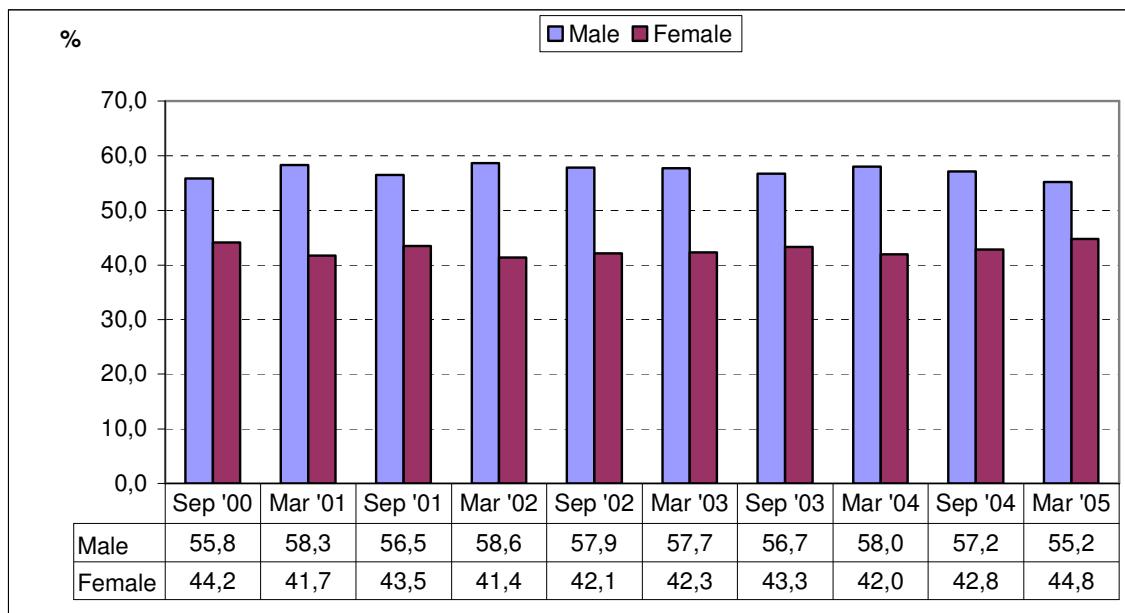

Figure 4 and Table 1.2 show that discouraged work-seekers are predominantly female. For example in September 2000, 5,8% of working-age men were discouraged work-seekers as against 10,0% of working-age women. By March 2005, the percentages of both groups had risen – to 9,9% of working-age men and 15,8% of working-age women.

4 Employment patterns

4.1 Employment by occupation

Figure 5: Percentage of persons employed in ‘more skilled’ occupations by sex

In Figure 5, persons employed in the three highest occupation categories are added together to make a single group regarded as ‘more skilled’. This group includes managers and senior officials, professionals/non-professionals and technicians. In September 2000 there were 2,3 million persons in ‘more skilled’ occupations – rising to 2,5 million in March 2005. Of these ‘more skilled’ personnel, and as indicated in Figure 5:

- In each period the percentage of men occupying such positions is somewhat higher than the percentage of women. For example, in September 2000, 55,8% of people in ‘more skilled’ occupations were men as against 44,2% of women.
- By March 2005, the gender gap had narrowed slightly – 55,2% of men in the ‘more skilled’ occupation category as against 44,8% of women.

4.2 Employment by industry

Figure 6: Percentage of persons employed in the agriculture, mining and manufacturing industries

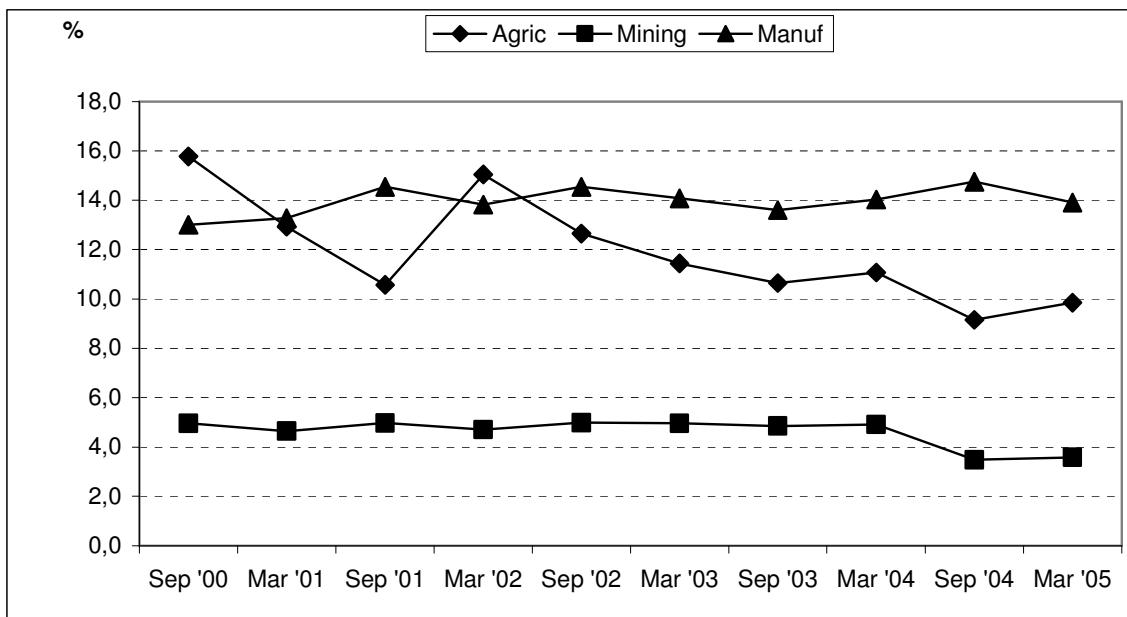

Figure 6 shows interesting trends in employment over the period September 2000 to March 2005, in agriculture, mining and manufacturing.

- Agricultural employment has been subject to large fluctuations as a result of drought. In September 2000 as many as 15,8% of all employed persons worked in agriculture, as against less than 10% in the most recent periods (September 2004 and March 2005).
- Employment in the mining sector reached 5% of total employment in September 2001, September 2003 and March 2003 before declining to 3,6% of total employment in March 2005.
- The percentage of persons employed in manufacturing has fluctuated between 13% and 15% over the period.

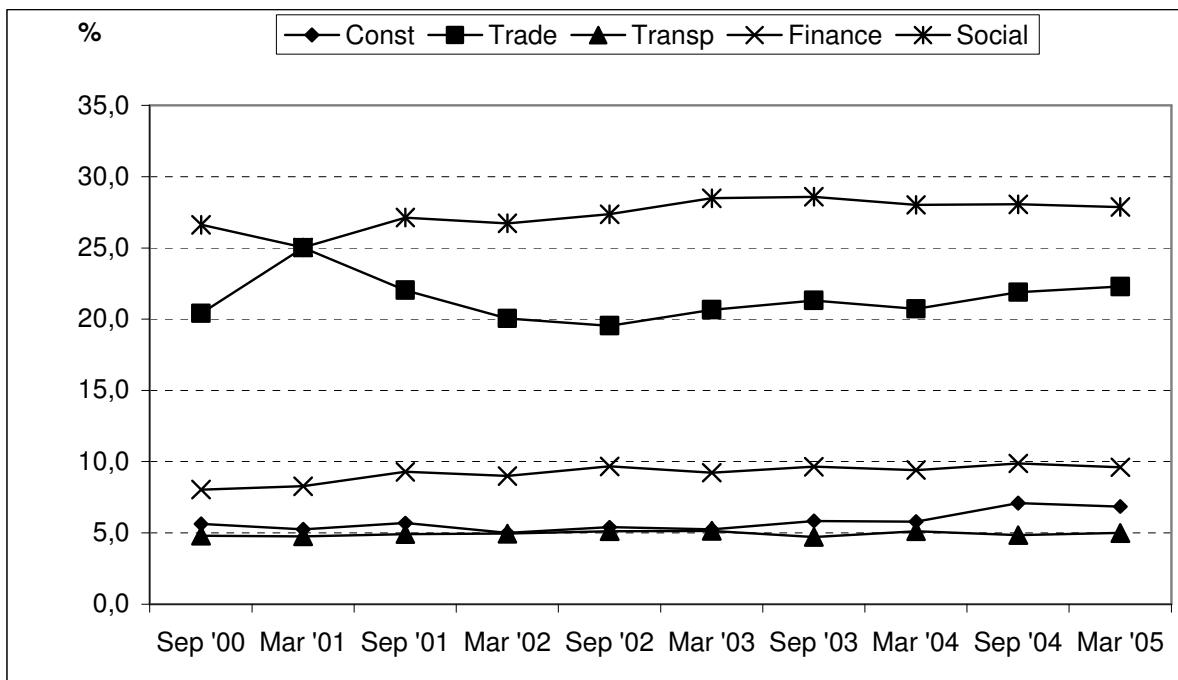

Figure 7: Percentage of persons employed in selected industries

Figure 7 highlights the importance of other industries in terms of the percentage of the employed working in each.

- Social and community services account for the largest share of total employment (over 25% of total employment in virtually every period) since September 2000.
- The trade sector makes the second largest contribution to employment, accounting for around 20% of total employment since September 2000. Employment in the finance sector accounts for 8–10% of total employment.
- And the percentages of persons employed in the transport and the construction industries are similar at 5–7%.

4.3 Employment by sector

Figure 8: Employment in the formal and informal sectors

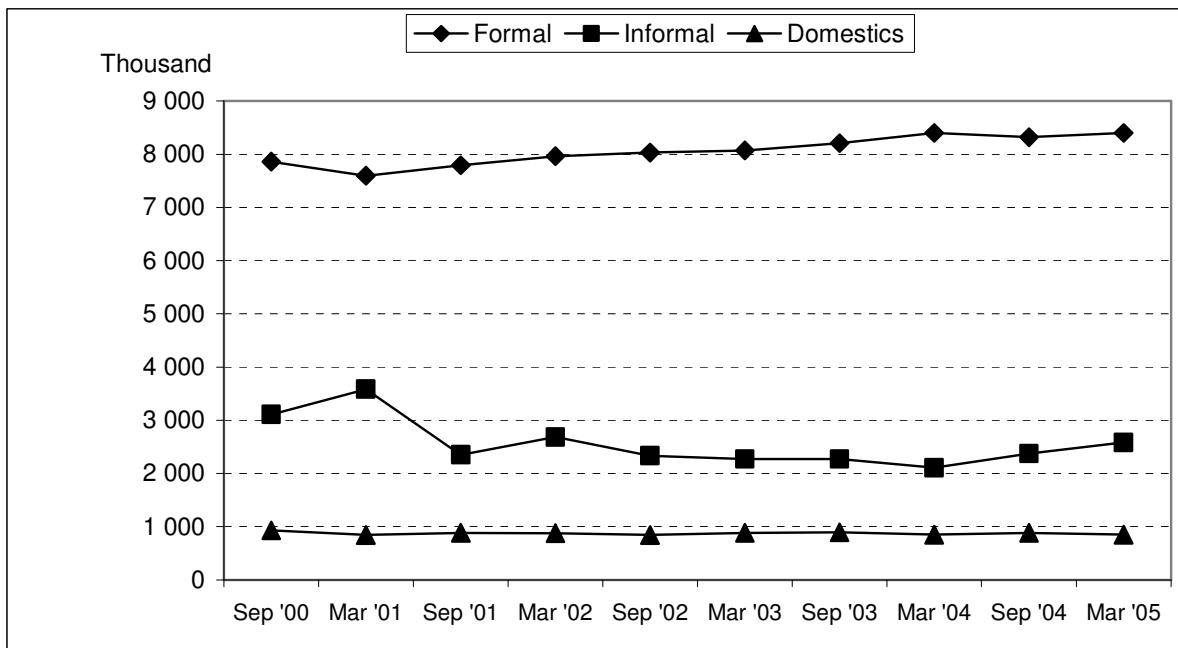

Figure 8 and Table 4.4 show that over the period September 2000 to March 2005:

- The trend in formal sector employment (including agriculture) has been generally upward. As a result, employment levels in the formal sector rose from 7,9 million in September 2000 to 8,4 million by March 2005. That is, the number of people working in the formal sector shows stability and consistent change over time.
- After declining from over 3,0 million in the early part of the decade (September 2000 and March 2001), employment in the informal sector remained in the two to three million range over the rest of the period to March 2005.
- The number of people working in the informal sector tends to be volatile over time. This could be, at least in part, a reflection of the instability of the sector as a whole, with ease of movement into and out of it. On the other hand, some of the variation could be explained by:
 - Proxy responses
 - Different understanding of the concept of informal work by the respondents, even though Stats SA trains fieldworkers to identify and probe for informal work
 - Language and translation difficulties.
